Nth Cycle

Investor Presentation

March 2026

NTH CYCLE

Executive Summary

1. **Massive Addressable Market:** Multiple tens/hundred-billion-dollar markets across black mass, copper, and rare earths with high strategic salience and corporate/government action

   $150bn+ midstream refining TAM

2. **Solves Critical Customer Pain-Points:** Western mid-stream refining can finally compete with decades-old hydro/ pyromet with easy-to-permit (6 mo vs 3y) & modular/low-capex (70% lower cap. intensity even at 5x smaller scale)

   >70% Lower cap intensity even at small scale

3. **Technology Risk Fundamentally Retired:** >1 year operating data from demo plant over 4 campaigns retires fundamental tech risk; remaining focus is optimized cell & engineering with key demo learnings

   3,000+ hours commercial operations

4. **Commercial & Government Traction:** Strong interest from Western and Asian strategics for investment and joint ventures + government grant/debt/equity investment

   5 Signed MOUs/TSs in Q1 2026 (to-date) alone

5. **Strong Project Returns:** 20-50% unlevered IRRs on near term projects; operate profitably at 10x lower scale vs competitors; project finance being unlocked for next plants with tech performance insurance

   20-50%+ project IRRs

6. **Broad IP Protection:** Issued patents control electro-extraction with porous electrode and adjacent spaces; interested strategics must partner with Nth Cycle to achieve value proposition

   4 patent families granted since inception

7. **Deep Management & Execution Team:** Leadership across engineering, chemistry, operations, finance, and sales & marketing; fundraise enables hiring of add'l project execution and delivery team as company focus shifts to global roll-out

   120+ years mgmt industry experience

8. **Rapid EBITDA growth:** Each 12ktpa black mass facility contributes >$35-40M EBITDA (>30% margins) on ~$100M capex; corp. cash flow breakeven expected by 2031 & ~$175M EBITDA by 2032; significant upside likely with impending policy shifts

   ~$175M EBITDA by 2032

NTH CYCLE

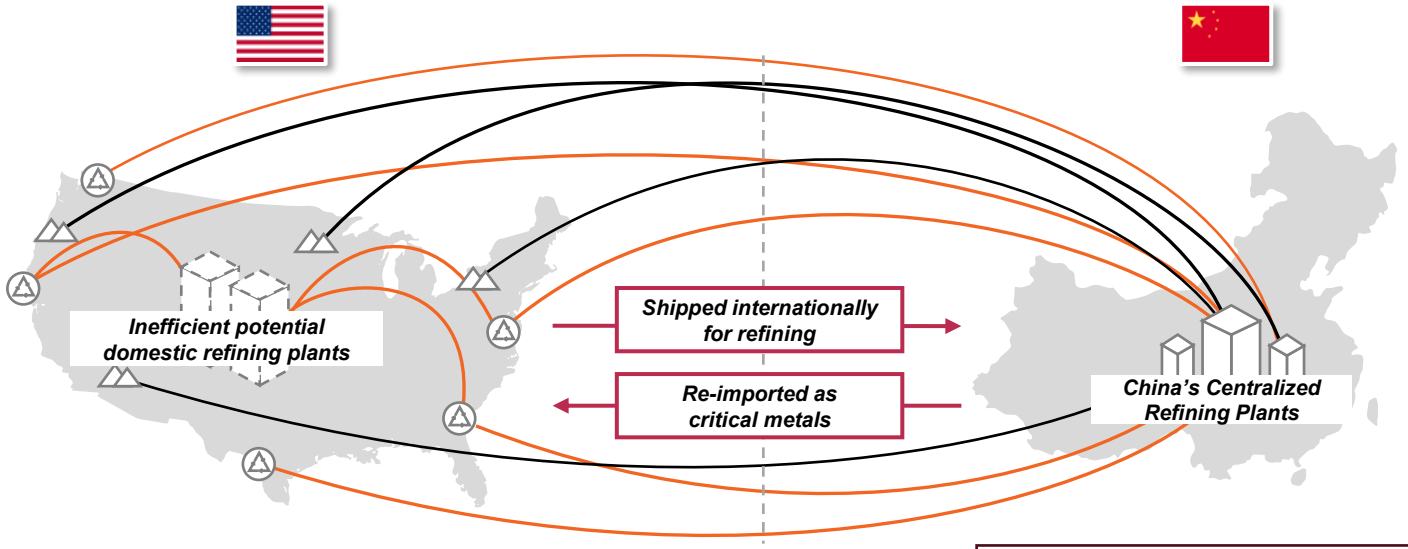
China controls >70% of global critical mineral refining

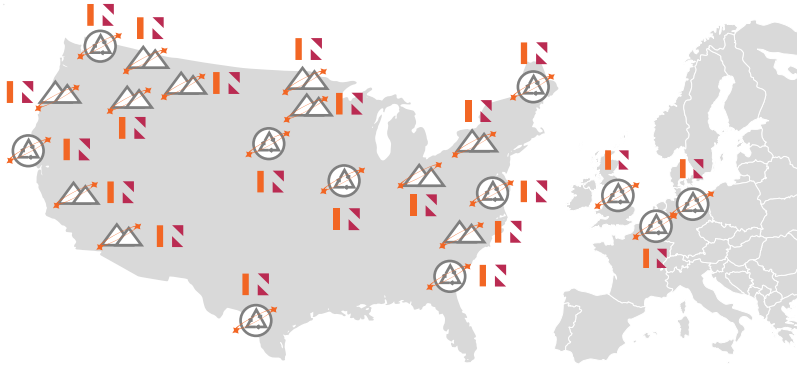
Without Nth Cycle

- × Recycled and mined materials are **shipped overseas to be refined in China** before being re-imported back to the U.S. and Europe for domestic use
- × Replicating China's refining model with existing tech would require **massive CapEx** spend and **years of permitting** approvals, and would still result in **inefficient supply chains** and inflexible refining

With Nth Cycle

- ✓ Nth Cycle's mission critical **modular** system efficiently onshores supply by **co-locating** refining technology across recycling facilities and mines[1]
- ✓ Refined critical metal sources can now be **localized** in geographic regions with the highest demand





Recycled materials | Mined ore | Recyclers | Mining sites

Note: Locations shown on map are selective examples for illustrative purposes
(1) Nth Cycle is actively developing its capabilities to work with miners as partners for feedstock supply

NTH CYCLE

Midstream refining capacity is the key focus for achieving domestic, closed-loop critical minerals supply chains

POLICY MANDATES & PUBLIC FUNDING (US + EU) ARE PRIORITIZING SUPPLY CHAIN SECURITY AND ONSHORE VALUE-ADD

MINING
Raw Materials

RECYCLING
Industrial
Scrap Metal
Black Mass

REFINING
Converts mined and recycling materials into usable critical metals for manufacturing

EVS
BATTERY STORAGE
RENEWABLE ENERGY
INFRASTRUCTURE
DEFENSE
AVIATION
PUBLIC TRANSIT
CONSUMER TECH

END OF LIFE

USA & EU: mandates & regulatory levers

Supply-chain security implications

- Western policy is shifting from I) access to ore ⟶ to II) control of processing + materials + recycling
- Policy is converging on: I) localization incentives, II) traceability & due diligence, III) faster permitting, and IV) resilience to China export controls
- Funding and procurement are increasingly tied to domestic value-add + provenance data (to maintain eligibility)

NTH CYCLE

However, current refining tech lacks capabilities for Western needs; enter Nth Cycle

SOLVING INDUSTRY PAIN POINTS, PROFITABLY AT 10X SMALLER SCALE

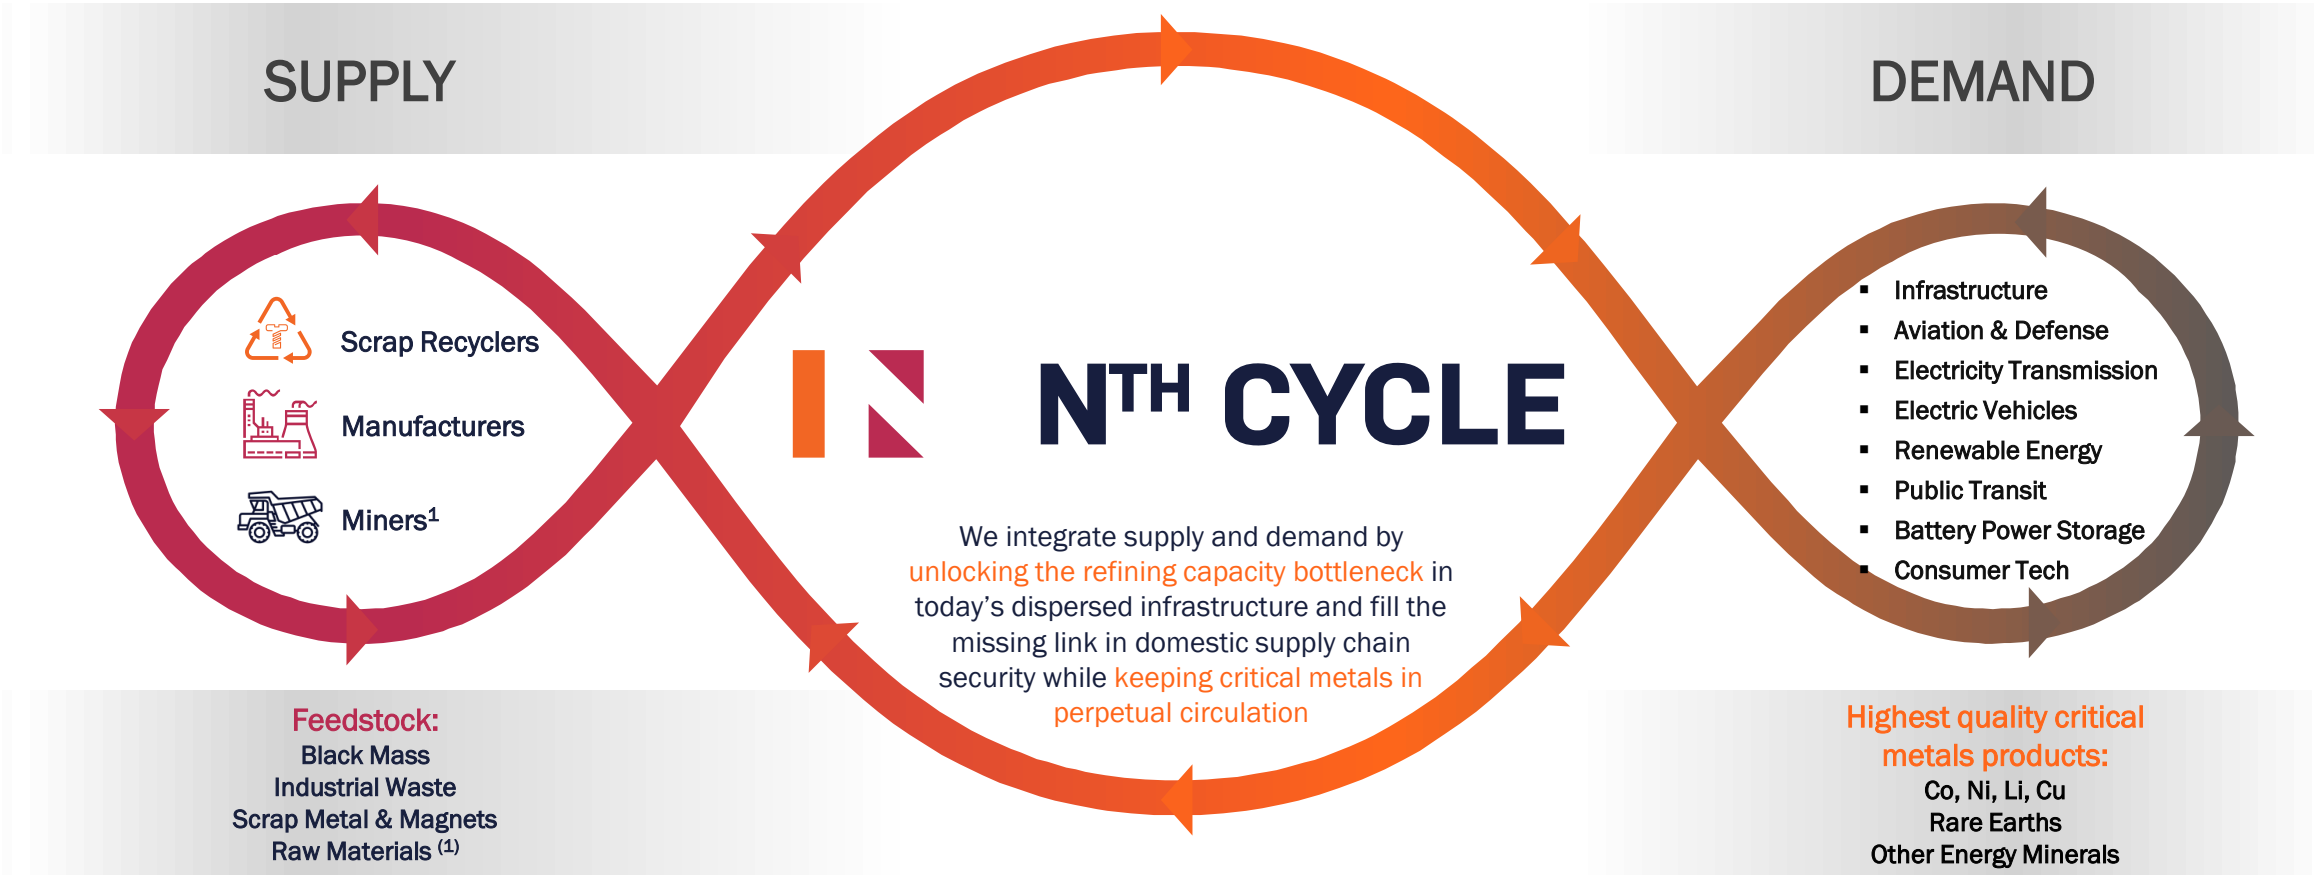
Current refining capability gaps	Nth Cycle solution
Almost zero domestic midstream refining capacity	Platform technology that targets industry pain points
Limited feedstock flexibility per technology	Single system for multiple, complex feedstocks
Slow to deploy (5+ yrs), hard to permit	Low setup friction (6 months permitting, <2 yr to production)
Requires large scale to be economic; doesn't match Western feedstock volumes	Cost effective at 10x lower scale than standard refining flowsheets[1]

NTH CYCLE

[1] e.g. 6,000tpa Nth Cycle black mass plant capital intensity of $9,500/t vs 60,000tpa industry standard

NTH CYCLE

Nth Cycle has a flexible, proven closed-loop technology for processing and recycling a range of critical minerals



[1]Nth Cycle is actively developing its capabilities to work with miners as partners for feedstock supply.

NTH CYCLE

OUR METALS

We refine critical metals with high supply chain risk

CURRENT FOCUS:		IN DEVELOPMENT:	
28 Ni NICKEL	Nickel	29 Cu COPPER	Copper
27 Co COBALT	Cobalt	60 Nd NEODYMIUM	Neodymium
3 Li LITHIUM	Lithium	59 Pr PRASEODYMIUM	Praseodymium
25 Mn MANGANESE	Manganese	Y, Tb, Ce, Sm	All other rare earth

TRANSITION > RARE EARTH > OTHER ENERGY ELEMENTS

NTH CYCLE

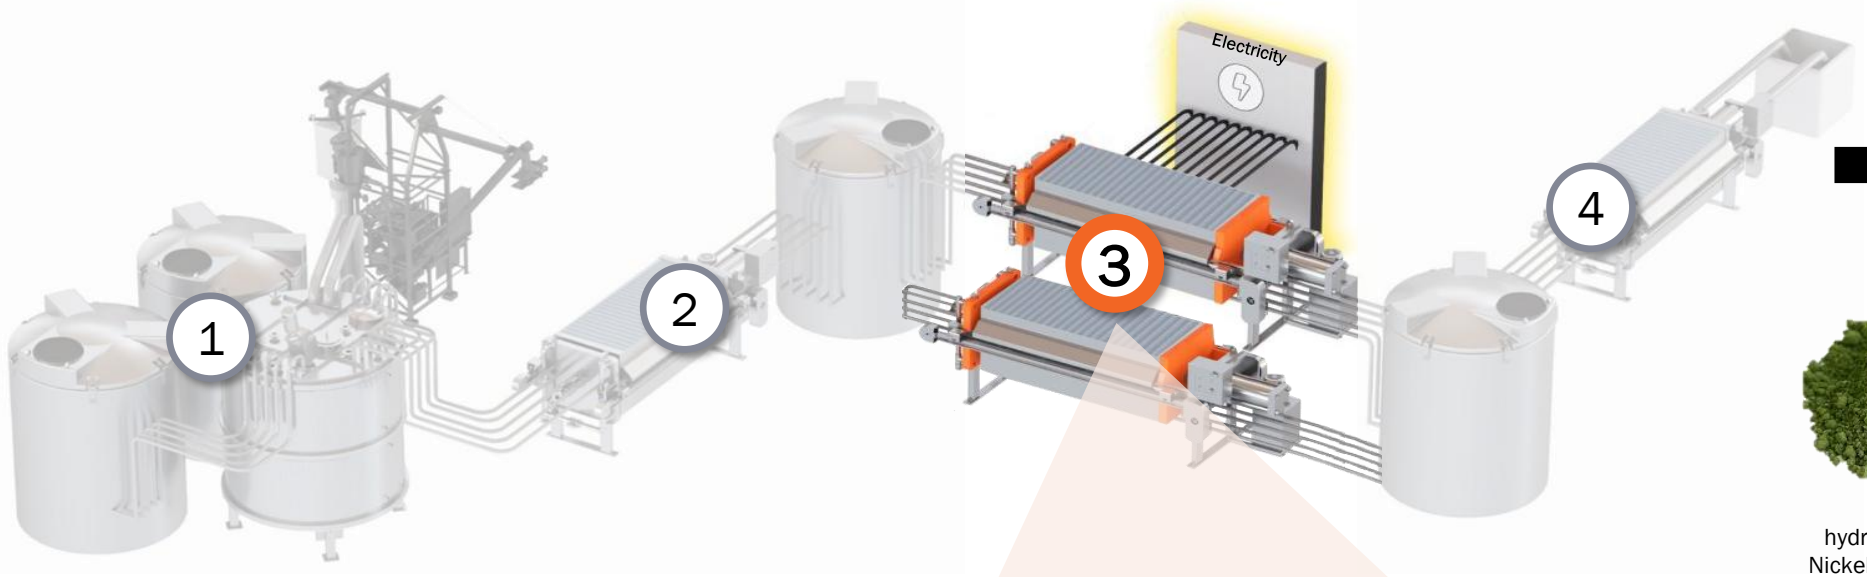
Nth Cycle's flexible refining platform has numerous advantages

ELECTROCHEMICAL PROCESS COMBINING NOVEL FLOW-THROUGH ELECTRODE TECHNOLOGY WITH STANDARD INDUSTRY UNIT OPERATIONS

UNIQUE ADVANTAGES OF THE OYSTER SYSTEM

- Achieves cost savings from reduction of transportation of inputs, waste elimination, and emissions reduction
- Continuous flow system materially increases production rate vs. traditional batch processes
- Customizable to changing feedstock volumes
- Low capex investment and rapidly deployable
- Small footprint, allowing for co-location benefits
- Ability to leverage off-the-shelf, readily available equipment
- Permitting timelines of less than 6 months and construction in under 12 months

Black mass
Battery scrap
Mining waste
Ore



High purity
hydroxides/carbonates
Nickel-Cobalt, Rare Earths

1 Pre-Processing Reactor
Metals dissolved from feedstock into an aqueous solution

2 Pre-Processing Filtration
By-products (e.g. Li carbonate & graphite) and impurities filtered out

3 Oyster Cells and End Plates
Electro-extraction; can be tuned to extract multiple targeted metals

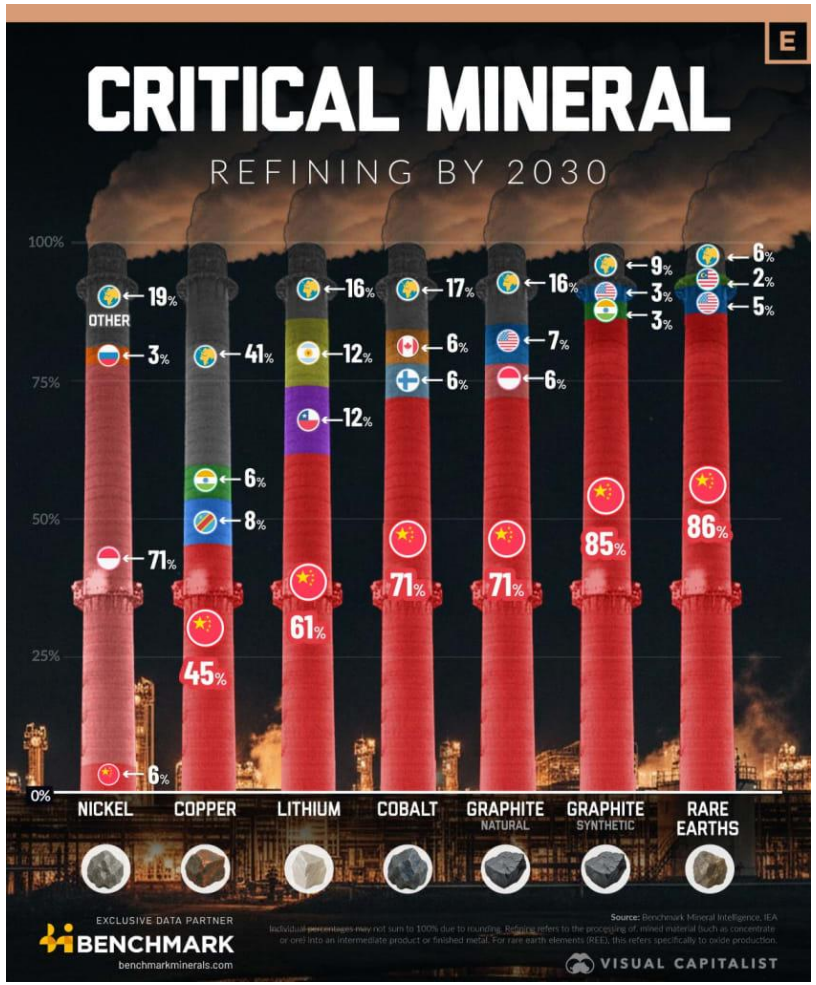
4 Post-Processing Filter Press
Product filtered and dried to partner specification

Off the shelf equipment (currently TRL 8) Proprietary technology (currently TRL 8)

NTH CYCLE

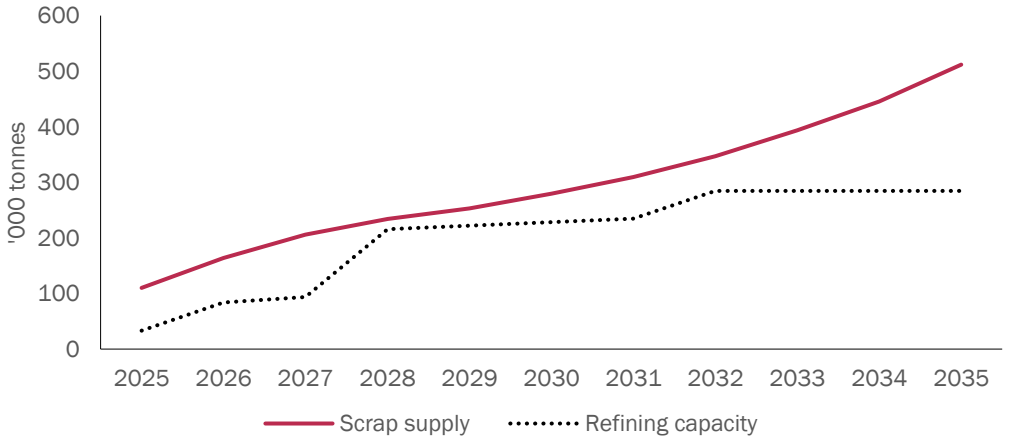
Initial Ni-Co market focus driven by scale of domestic refining needs

THE US AND EU HAVE NO MEANINGFUL REFINING CAPACITY OF Ni, Co OR Li…

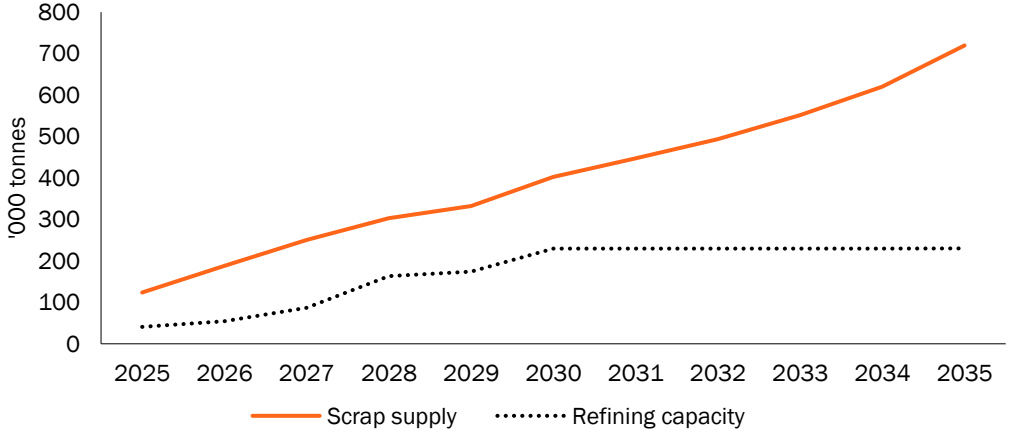


…AND BLACK MASS REFINING CAPACITY IS INSUFFICIENT FOR PROJECTED VOLUMES

NORTH AMERICA



EUROPE



Source: Benchmark Minerals Research Dec 2025, Fastmarkets Q4 2025 Battery Recycling LT forecast (with adjustments based on discussions with Fastmarkets post publication)

NTH CYCLE

Nth Cycle's novel technology & focused deployment strategy enable success where others failed

LARGE PROJECTS FAILED DUE TO USE OF TRADITIONAL TECHNOLOGY THAT WASN'T SUITABLE TO WESTERN PERMITTING REGULATIONS AND MARKET DYANAMICS, AND COMPANIES MAKING RISKY FULL VERTICAL INTEGRATION BETS

Vertical integration from shredding to CAM manufacturing too challenging/not economic

Traditional hydro technology too expensive to build in the West

Need large scale to operate, capex blowouts

Unable to permit with traditional tech, particularly in EU

Sodium waste issue pervasive with traditional tech

Permitting timelines delaying projects by years

Nth operates profitably at 10x smaller scale

Nth permitted in 6M

List not exhaustive

NTH CYCLE

Unique advantages compared to traditional refining methodologies

NTH CYCLE'S UNIQUE ADVANTAGES COMPARED TO TRADITIONAL REFINING METHODOLOGIES FOR NICKEL AND COBALT

Technology	Pyrometallurgy	Hydrometallurgy	Nth Cycle Electro-Extraction	Nth Cycle Advantage
Recovery	59 - 77%	78 - 96%	>98%	Efficient
Purity	80 - 95%	95 - 99%	>99%	High grade
Footprint	75+ acres	75+ acres	2 acres for equivalent scale ¼ acre for 6 ktpa	Siting flexibility
Time to Permit	12 - 24 months or more	12 - 24 months or more	< 6 months	Faster deployment
Time to Construct	2 - 5 years	2 - 5 years	12 - 18 months	Faster deployment
Minimum Viable Capacity	Fixed, >50ktpa capacity	Fixed, >50ktpa capacity	Modular, from 6ktpa capacity	Scales down
Capital Intensity[1] / Capital Outlay	~$5,000 – $10,000 / tonne >$1bn / project	$27,500 / tonne[2] ~$1bn / project	~$7,500 – $9,500 / tonne ~$50-80mm / project[3]	Economics work at 10x smaller scale
Energy Consumption	High	Medium	Low	Energy efficient
Environmental Considerations	Air pollution, wastewater discharge, solid waste and minimal GHG reduction	Acidic & alkali waste, wastewater discharge and minimal GHG reduction	Almost zero waste and reduced pollution	Industry-leading pollution mitigation
Players	GLENCORE, BASF We create chemistry	ASCEND ELEMENTS, green Li-ION, REDWOOD MATERIALS, umicore		US-based solution for metal refining

Source: Company websites and filings
[1]Per tonne of black mass
[2]Based on the costs of Li-cycle's Rochester hub.
[3]Estimated development CapEx for 6,000tpa plant. At similar 50 ktpa megaplant scale, Nth cycle would be >60% lower capex intensity. CapEx costs may vary depending on specific commodity type or commercial structure

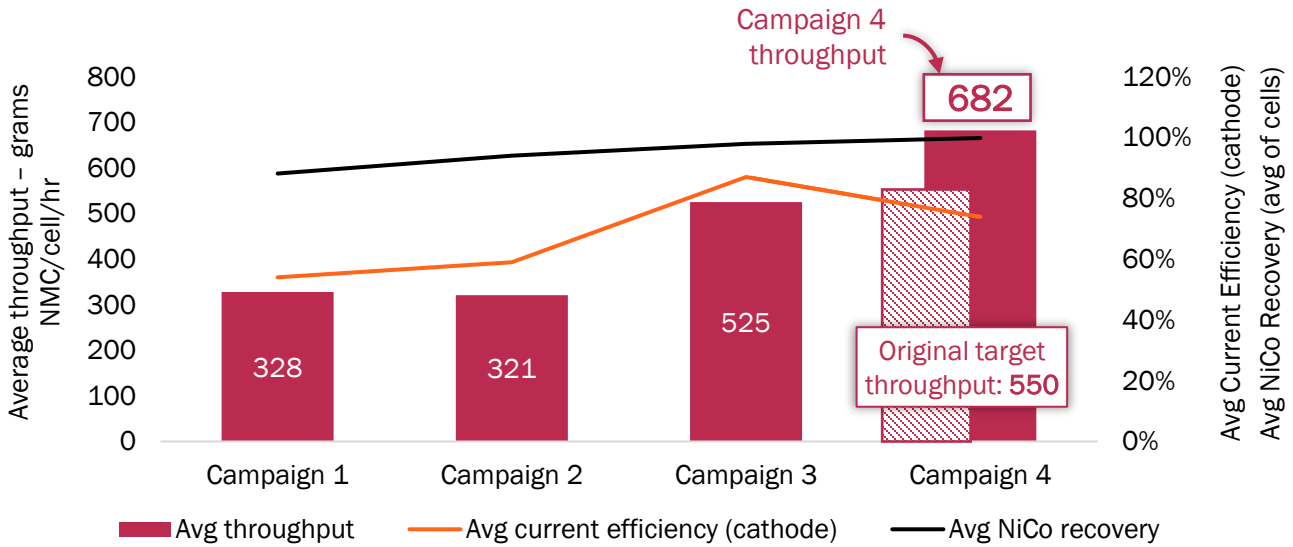
NTH CYCLE

Nth's Ohio demo plant met core technology goals & successfully proved integration into standard refining flowsheets at-scale

OHIO PLANT OVERVIEW

- Cell modules deployed **10**
- Cumulative run time **>3,400 hours**
- NMC recovery **>99%**
- NMC product purity **>98%**
- Total production to date **>22t NMC hydroxide**

CONTINUED SYSTEM IMPROVEMENTS OVER THE 12 MONTHS OF OPERATIONS



PLANT WALK-THROUGH VIDEO

https://www.youtube.com/watch?v=WqAN1ka16p8

NTH CYCLE

Learnings from Ohio enable low-risk modular scale-up and moving down the cost-down curve with virtuous cycle of learnings

PROOF POINTS

1. **Flowsheet integration:** Core tech successfully integrated seamlessly with standard off-the-shelf equipment
2. **System operations:** Learned how the entire system behaves under variable scenarios, during startups, through maintenance and at-scale
3. **Core tech operations:** Multiple campaigns with controlled shutdowns and restarts to identify causes for failure; maintenance schedules determined
4. **Flexible feedstock:** Performance and product purity maintained with diverse feedstock compositions tested
5. **Fast deployment:** Validated rapid deployment thesis with 6 months permitting + 12 months construction

MODIFICATIONS PLANNED FOR COMMERCIAL ROLLOUT

Automation

- Identified opportunities to reduce cost and improve controls through upgraded automation package
- Rockwell partnership secured and upgraded system being integrated into flowsheet with Fluor

Rockwell Automation

Cell design

- Identified material cost reductions through simplification of design for manufacturing, while increasing throughput by 4x and lifetime by >3x

Modified equipment choices

- Identified basic engineering modifications for next plant (e.g. continuous reactor vs. batch reactor to improve utilization and recovery, proper pump specs, dialled-in filtration equipment sizing)
- Fluor has already completed review and started engineering

FLUOR®

NTH CYCLE

We are commencing project development on multiple plants in the USA and Europe with compelling returns

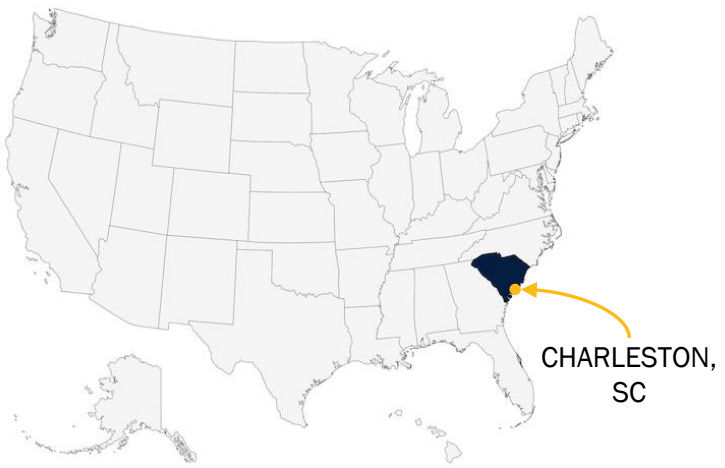
- Either topCo or project financing of these two projects would enable corporate cash flow breakeven
- Can capture 50-70% of project value (e.g., EBITDA of $15-20M/yr to Nth for 12ktpa plant) as carry equity in gov debt/export ban case

	South Carolina	Netherlands
Project overview	▪ Location: Port of Charleston ▪ Capacity: 12,000t black mass equivalent per year ▪ Feedstock: Black mass, Ni catalyst waste ▪ Products: NMC hydroxide, Li carbonate (battery–grade), industrial-grade graphite ▪ Production[1]: 2,200 t NiCo contained, 1,500t Li_2CO_3	▪ Location: Port of Rotterdam ▪ Capacity: 6,000t black mass equivalent per year ▪ Feedstock: Black Mass, Ni catalyst waste ▪ Products: NMC hydroxide, Li carbonate (battery–grade), industrial-grade graphite ▪ Production[1]: 1,100 t NiCo contained, 750t Li_2CO_3
Capex	$99M	$63M
Returns - IRR	26% Base - unlevered; 46% Base - levered; 71% Levered + export ban (Most likely scenario)	19% Base - unlevered; 22% Base - levered; 33% Levered + grant (Most likely scenario)
EBITDA	$35-40M/yr	$10-15M/yr

Source: Summary Model as of March 2026. Commodity prices scenario: Fastmarkets LT forecasts as of Q4 25
South Carolina project assumes 70% debt, Netherlands assumes 50% debt in levered scenario
[1]Final production volumes dependent on black mass feedstock composition

NTH CYCLE

USA: South Carolina project overview



Location

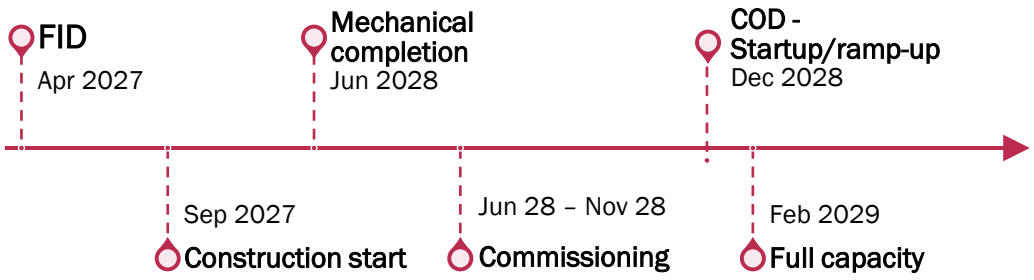
- Port of Charleston, SC, USA

Project Overview

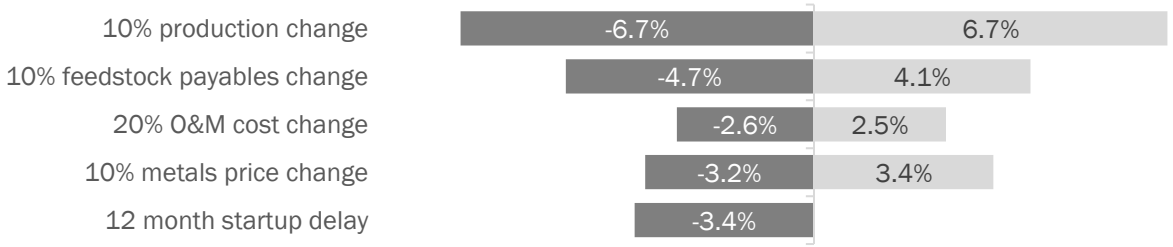
- Independent plant to be built, owned and operated by Nth Cycle
- Capacity: 12,000t black mass per year
  - Expected to be one of the largest black mass refineries in the US
- Capex ~US$100M
- Timeline: Targeting mid-2028 commissioning
- Strategically positioned at Port of Charleston for import/export logistics
- South Carolina very supportive of infrastructure projects with strong incentives
- Existing ecosystem of black mass supply chain developments in the region

Status

- Black mass supply agreements currently being negotiated with a number of potential suppliers including shredders, traders (Traxys, Trafigura) and OEMs
- Offtake agreements for MHP signed with Trafigura, negotiations ongoing for further MHP and Li_2CO_3 under negotiation with large North American and S Korean refiners and Traxys



SENSITIVITY ANALYSIS: 26% UNLEVERED BASE CASE



Source: Company Model as of March 2026

Trafigura NTH CYCLE

- Largest multi-metal offtake agreement between a recycled black mass supplier and critical mineral refiner
- Signed in March 2026 at Trump Administration's inaugural Indo-Pacific Energy Security Forum in Tokyo
- 10Y contract
- Trafigura will purchase 2,000 tonnes of contained nickel in mixed hydroxide precipitate (MHP) and 1,500 tonnes of lithium carbonate across all of Nth Cycle's assets
- Marks a significant milestone for Western supply chains and the largest multi-metal commercial agreement between a recycled feedstock supplier and refiner.

Trump Administration Announces Deals Totaling $56 Billion During Indo-Pacific Energy Security Summit

NTH CYCLE

USA: Significant funding discussions with US Government ongoing

MAJOR FUNDING FOR OUR FIRST PLANT, R&D, AND COMPANY TOPCO, EXPECTED DEAL BY Q2 '26

NTH CYCLE CURRENT US GOVERNMENT ENAGEMENT

- Ongoing discussions with Dept. of Commerce to fund flagship US black mass refining project with a combination of debt and equity
  - Engaging Dept. of Energy regarding the $500M Battery Materials Processing and Battery Manufacturing and Recycling award. Funding has not yet been released but is regular discussion with senior DoE leadership regarding timelines
- Ongoing discussions with White House and Dept. of War to fund rare earth process development with a combination of debt and equity
- Engaging with Dept. of State and US Embassy Seoul (South Korea) on partnerships with leading Korean battery and battery material (pCAM and CAM) manufactures in support of forthcoming Trade Framework agreements
- Engaging Congress (member-level meetings) to drive significant critical mineral policies (export ban, price floors, workforce training)
- US Government is driving expedited timeline to announce more projects ahead of midterms

United States

$2.5 billion	Funding for Department of Energy loan programs office
$1.3 billion	Battery Materials Processing and Battery Manufacturing & Recycling
$76 million	Electric Drive Vehicle Battery Recycling and Second Life Applications
$60 million	Bipartisan infrastructure law for research into battery recycling
$50 million	Bipartisan infrastructure law for local governments
$15 million	Bipartisan infrastructure law for retailers to fund battery recycling programs

Europe

€3 billion	Innovation Fund for battery recycling
€67.6 million	Relieve Project - suspended in October 2024

Japan

$14.4 billion	Green innovation fund for ¥2 trillion until 2050 to achieve carbon neutrality

South Korea

$5.3 billion	Government four-year LiB technology development project for 7 trillion Won

ENGAGEMENT TIMELINE

- **MP Materials deal announced** Jul 2025
- **DoE $1B NOIs announced** Aug 2025
- **Nth Cycle meetings with White House, Commerce, and DoE** Sep 2025
- **Vulcan + ReElement deal announced** Nov 2025
- **Nth Cycle meetings with White House, Commerce, DoE, and State** Dec 2025
- **Nth Cycle visit to Embassy Riyadh (Saudi Arabia)** Jan 2026
- **Nth Cycle visit to Seoul & Tokyo** Feb 2026

NTH CYCLE

EU expansion: €7.5M Netherlands grant to co-fund operational expansion to Europe

NETHERLANDS HQ CONDUCIVE TO ACCELERATING PIPELINE GIVEN HIGHLY FAVORABLE MARKET DYNAMICS

NTH CYCLE

Europe presents optimal conditions for Nth Cycle…

- European black mass production is and will be more than 2x that of the U.S
- Minimal refining capacity with significant customer fragmentation results in high demand
- Black mass in Europe trades at a meaningful discount vs. Asia/USA
  EU black mass transport restrictions
- EU environmental policy agenda aims to turn decarbonization into a driver of growth for European industries

…The Netherlands is the most tactical location to leverage

- Award of €7.5M[1] grant in 2025 + Strong existing relationships with key government
- Proximity to massive EU market and consumers
- Transport benefits given access to ports (Including Rotterdam), rail and highways
- Demand from heavy-duty mobility industry as well as many suppliers for battery technologies

[1] *Nth Cycle applied to the Dutch National Growth Fund's battery circularity call together with a consortium of battery value chain participants ("CRM Lion"), part of BCC-NL. The consortium was granted a total grant subsidy of €13.5M. Nth Cycle received the largest share of the subsidy totalling €7.5M to Nth Cycle*

NTH CYCLE

TAM expansion: we are expediting Cu and REE platforms given strategic interest

- Reprioritizing development path for Cu and REE given strong strategic and government interest
- Commercial deployment by 2028
- Cu and REE deployment expected to be through license/O&M model to focus solely on core tech value-add to partner flowsheets (unlike Ni-Co-Li deployments) – more amenable to mining and larger development projects
- This model opens large market opportunities without competing for feedstock with other refiners
- Expect to form new business units or spinoffs with these platforms to ensure management focus

60 Nd NEODYMIUM | 59 Pr PRASEODYMIUM

Up to 60% reduction in consumables opex[1] for REE refining flowsheets through in situ chemical generation

Now
Bench scale
2028
Commercial scale cell deployment

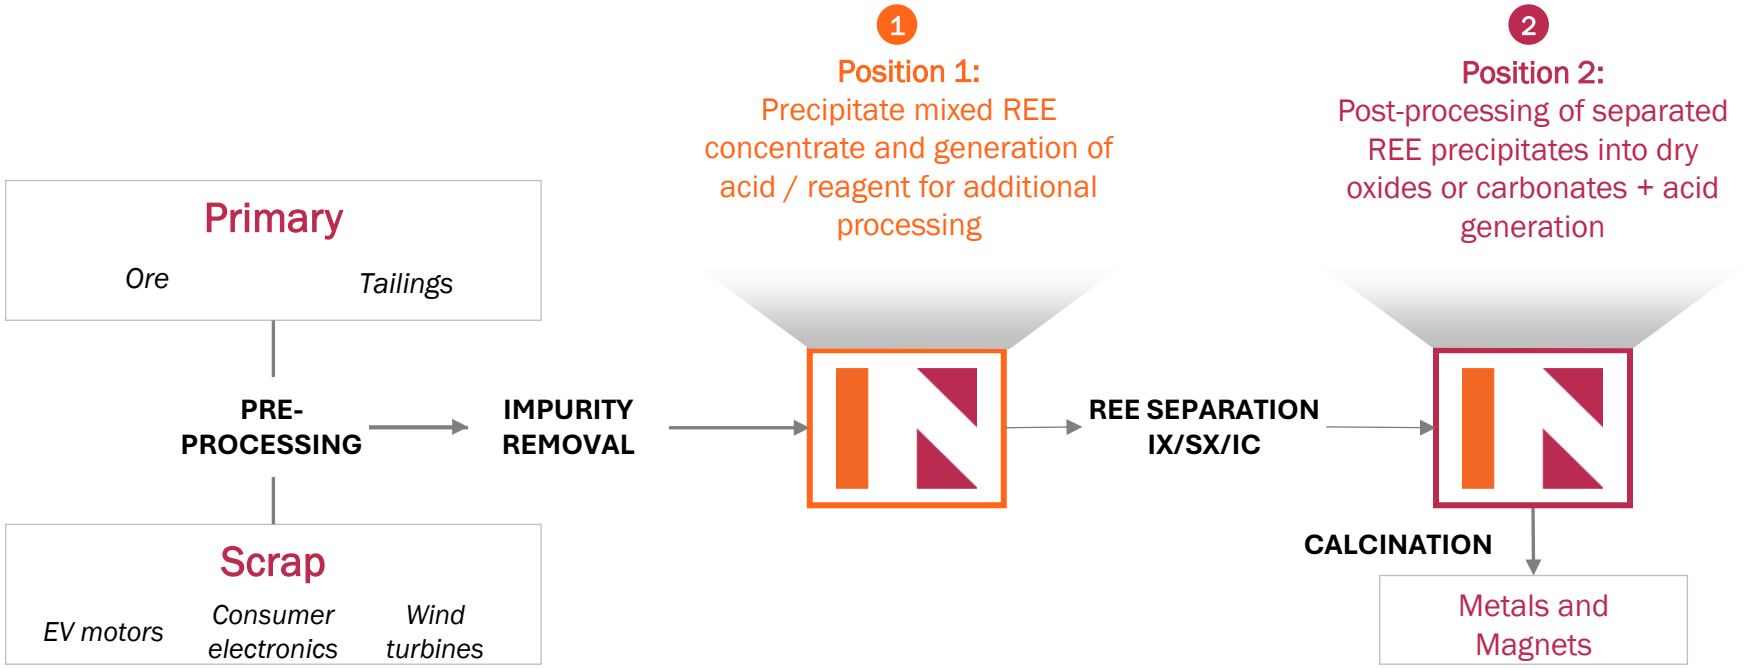
License / O&M model

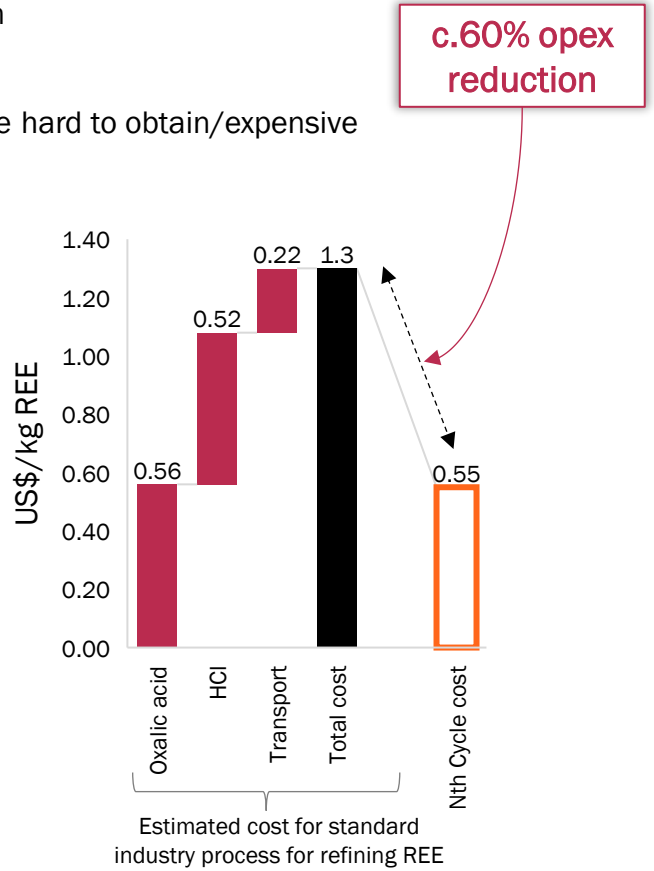
[1]Chemcial costs represent the largest component of opex in REE refining

NTH CYCLE

Rare Earths: Drop-in technology to significantly reduce cost in REE flowsheets

- Nth Cycle's focus in REE is to add value to standard REE refining flowsheets through material cost and/or capex reductions, benefiting all REE separation technologies
- This is through providing in-situ generation of acid and base, which are the most significant cost drivers in standard REE refining (e.g. oxalic acid, HCl, ammonium carbonate)
- Nth's process simultaneously produces the chemicals used for leaching, impurity removal, solvent stripping, and precipitation
- **This leads to a 60% reduction in cost for the stripping and precipitation stage of the process**
- Nth benefits partners with REE separation technologies but is also particularly relevant for remote mines where chemicals are hard to obtain/expensive
- Permitting also materially reduced due to lower waste/air emissions





Assumptions: Oxalic acid: US$0.60/kg, 36% HCl cost US$0.30/L, Electricity cost US$0.05/kWh
[1]Based on Nd-only bearing stream of 20,000 Lpa at 8% concentration producing 1,800 mtpa of REO (dry). [2]Assumes transport cost is 20% of bulk chemical cost. Excludes labour cost

NTH CYCLE

Copper: Electro-extraction offers material improvements vs. standard electrowinning

	Rationale	Standard Electrowinning	Electro-extraction
FASTER PRODUCTION RATE	– Up to 8x faster than standard electrowinning – Achieved through higher current density and flow through electrode technology	<400 $gm^{-2}hr^{-1}$	>2,100 $gm^{-2}hr^{-1}$
REDUCED FOOTPRINT	– High production rate results in 8x smaller footprint required for given feed – Material reduction in capex – Access to stranded assets and low-quality feedstocks where scale<>capex is an issue	✗ Large bath houses	✓ Small oyster units
HIGH SELECTIVITY	– High selectivity for Cu from heterogenous feeds, potentially avoids SX – Can be placed in series for extraction of other valuable metals (e.g. gold, black mass processing)	- Selectivity from solvent extraction	✓ High selectivity
RAPID DEPLOYMENT	– Rapid deployment due to reduced permitting needs and flexible capacity – Quick incremental capacity additions to existing facilities	✗ Slow to deploy	✓ Rapid to deploy
HIGH VALUE PRODUCT	– High value applications – Sale price up to 10x LME cathode price – Alternatively can be sold for remelt	- Standard cathode product	✓ Higher value powder

NTH CYCLE

We will deploy 18 projects by 2036 across our initial 3 platforms

NTH CYCLE

Visionary management team with extensive experience in project development and strong focus on scaling technology

COMBINED INDUSTRY EXPERIENCE OF OVER 120 + YEARS

Megan O'Connor, PhD
CO-FOUNDER AND CEO
Industry Experience: 10+ years

Has led the company to commercialization in six years, >$80M raised; Forbes 30 Under 30, BNEF Pioneer, GRIST 50, TIME 100 Most Influential Climate leaders 2025; INC 500 Female Founders

PhD in Environmental Engineering

Chad D. Vecitis, PhD
CO-FOUNDER AND CHIEF SCIENTIST
Industry Experience: 15+ years

90+ peer-reviewed publications and multiple patents; inventor of Nth Cycle core technology

Professor in the School of Engineering & Applied Sciences at Harvard University; PhD in Chemistry

Raffi Freeman
CHIEF FINANCIAL OFFICER
Industry Experience: 15+ years

Extensive experience as a founder, investor, & advisor in renewable energy project development & industrial climate tech. 3x IPO, 1x major acquisition

Managing Partner & Founder at Original Position Ventures and Venture Partner at Clean Energy Ventures

Gabi Knesel, PhD
CHIEF TECHNOLOGY OFFICER
Industry Experience: 15+ years

Extensive experience in mining & metals operations, hydrometallurgical process innovation and commercialization of industrial technologies

Has multiple patents and is a mining advisor for AstroForge; PhD in Geochemistry

Guillermo Espiga
VP, BUSINESS DEVELOPMENT
Industry Experience: 25+ years

Experienced professional in energy, water and infrastructure project development

Leadership positions in successful development companies such as InterGen and Poseidon Water. Has led and executed projects in excess of $4bn

Alexander Allen
VP, CORPORATE DEVELOPMENT
Industry Experience: 10+ years

Experienced investment banker focused on the metals and clean tech sectors. Formerly a geologist in copper, gold, uranium

MSc in Metals and Energy Finance from Imperial College London

Allie Wiegel
CHIEF OF STAFF
Industry Experience: 8+ years

Experienced operator with a background in corporate sustainability, specializing in carbon accounting and low-carbon transition planning, as an in-house strategist and consulting advisory roles.

Master of Environmental Management from Yale University.

Sakina Evans
VP, PEOPLE
Industry Experience: 25+ years

Former VP of People at Bose Corporate, spanning a 21-year career at the company. Currently on the Board of Advisors for the Women's Foundation of Boston

BSc in Psychology from University of Toronto

NTH CYCLE

Issued claims covers all porous cathode-based metal recovery, key innovation for high-throughput, low-cost modular electrochemical production; other protection through defensive licenses and trade secrets

	Patents				Licenses	Trade Secrets
	Nth Cycle U.S. Patent No. 12,404,596	Yale U.S. Patent No. 12,208,399	Yale U.S. Patent No. 11,103,878	Harvard U.S. Patent No. 9,827,517	Exclusive Yale and Harvard Licenses for "Recovery of Metals and Metal Compounds"	Critical Operational Process Knowledge
Coverage	Electrochemical metal deposition system and method	Expanded Coverage of 11,103,878	Electrochemical separation & recovery of metals	Electrochemical carbon nanotube filter and method	Industry and IP	Technology and Project Development
Nth Cycle Protection	Patent Issued September 2025[1]	Patent Issued January 2025	Patent Issued August 2021	Patent Issued November 2017	Optionality in Royalty Payments	Competitors Cannot Reverse Engineer Tech

[1]Patent issued in USA, Canada and Australia. Patent pending based on original Nth Cycle research in Singapore, Mexico, Chile, Brazil, Qatar, India, New Zealand, Japan, South Korea, South Africa, Israel, and the European Patent Office countries under the Patent Cooperation Treaty

NTH CYCLE

Funding overview and milestones

USE OF FUNDS

Equity raise of >$50M to secure:

- 24 months' runway
- FID at 2 Ni-Co-Li projects in the US and Netherlands
- Rare earth and copper platforms ready for commercial deployment
- Elimination of debt

	US$M
Baseline	
Corporate costs run-rate for 24 months	21.0
Loan amortization/interest	8.2
Ohio plant operations	3.7
Subtotal	*32.9*
Incremental	
Cell industrialization	5.0
Project development	8.7
Corporate headcount growth	3.2
Cell assembly facility capex	3.8
Subtotal	*20.7*
TOTAL Corp Raise	53.5

MAJOR MILESTONES

- Q2 26: Complete FEL2 engineering study for MHP flowsheet
- Q3 26: Begin FEL3/FEED engineering studies for US & EU plants
- Q4 26: Ni-Co next generation commercial scale cell testing complete
- Q2 27: REE & Copper commercial scale cell testing complete
- Q4 27: US & EU plants begin construction
- Q3 28: US & EU plants begin commissioning

FUNDING TIMELINE

- Jan 26: Series C launched
- Jan-May 26: Series C fundraise DD process
- Concurrent strategic investment & US government investment process
- Jun 26: close Series C

EXISTING INVESTORS

CLEAN ENERGY VENTURES
VoLo Earth
NSF
CATERPILLAR
equinor
AUTODESK
U.S. DEPARTMENT OF ENERGY
MassMutual
Elemental Impact
INNOVATION CROSSROADS
OAK RIDGE NATIONAL LABORATORY
